

## Day 73- 90 days of Analytics: Pip and Packages

In today's video, we briefly described pip and packages

The following were mentioned

- PIP is a package manager for Python packages. Python version 3.4 or later, includes PIP by default.

- A package contains all the files needed for a module. Modules are Python code libraries we can include in projects.

- To check if PIP is Installed, we use the command : `pip --version`

- Downloading a package is very easy. We open the command line interface and tell PIP to download the package you want. Example

```
pip install numpy
```

- Once a package is installed, it is ready to use. We use the **import** keyword to include it in our script. Example

```
import numpy
```

- We use the **uninstall** command to remove a package. Example

```
pip uninstall numpy
```

- We use the **list** command to list all the packages installed on your system. Example

```
pip list
```
