

Day 57 - 90 days of Analytics: Power BI Dashboard Project

In today's first video, we built a dashboard with Power BI

The following were mentioned

- To connect to MySQL Database, we need to install **MySQL Connector/NET**
- It is important to rename table after importation from the database
- Data tables can be gotten from the web via the page URL
- In the power query editor, the Merge option permits us to merge two table with matching columns. It works just like JOINS in SQL
- The replace values option on a column permits us to change all instances of a value in on go
