

Day 55 - 90 days of Analytics : Conditional Formatting

In today's video, we looked at conditional formatting in Power BI

The following were mentioned

- Data can be presented in tables rather than charts in Power BI
- The data in the tables can be formatted according to our preferences
- Under the "Column" option in the "Visualization" pane, we select a column and click to the arrow pointing downwards next to it. We select conditional formatting from the menu that appears.
- The options Conditional formatting proposes to us include
 - Background color
 - Font Color
 - Icons
 - Web URL
 - Data bars
- Excel users are familiar with the above-mentioned options
- We chose our options and apply them according to our preferences.
- Data bars are mostly used in conditional formatting. They work only on numerical values.
